It allows you to create macros from any window in your computer and then schedule them to be run at the right time or even on demand.A new study published today in the Journal of Developmental and Behavioral Pediatrics finds that every year, more children are exposed to potentially toxic levels of the pesticide chlorpyrifos. Researchers from the University of California, Berkeley School of Public Health and the Berkeley Law School analyzed data on nearly 80,000 people from the National Health and Nutrition Examination Surveys, an ongoing, cross-sectional health survey conducted by the US Centers for Disease Control and Prevention. They found that the average number of children exposed to pesticides is growing—and that it's mostly happening in communities with poor access to health care. "The CDC is conducting a major effort to address the pesticide exposure problem and we strongly urge them to expand this into an emphasis on reducing toxic pesticide exposures in all of us," says coauthor Kristin Lue, an environmental health researcher at the University of California, Berkeley School of Public Health. In 2014, 8 percent of children nationwide—or about 1.5 million—were exposed to low levels of pesticides. The percentage rose to 9.5 percent in 2015. The exposure rates were higher in states with the least access to health care, the researchers say. That's no surprise, says Lue, who adds that there are also disproportionate effects for communities of color. "In these communities, access to health care is probably the most critical factor to health outcomes," says Lue. The authors write that access to medical care alone could reduce pesticide exposures by more than half. Two-thirds of the children surveyed had been exposed to multiple pesticides, compared with one-third of adults. Pesticide exposures increased with income; 6.5 percent of children in households earning less than $20,000 per year were exposed to pesticides, compared with 11.4 percent of children in households earning more than $50,000. The researchers found that children who had been exposed to chlorpyrifos were more likely to have trouble speaking. Also, the more pesticides they were exposed to, the more likely they were to have a low IQ. 77a5ca646e
