diet file date aprilatiz Mar 31,
2020 at 10:30 pm. I want to know
if there is any possible script for
this? I've tried to search for this
but I can't find. Your help is
much appreciated. A: In addition

to all the output from the shell command, you also get a lot of side information printed to `STDOUT`, including the file name, the process ID, the start time and the end time, and so on. To get only the time information, you need to discard all that other output. In Python, the easiest way to do that is to use the following:

```
import subprocess
p = subprocess.Popen(cmd,
```

`stdout=subprocess.PIPE,`
`stderr=subprocess.PIPE)` `out, err`
`= p.communicate()` print out print
err In your code, the "err"
variable will contain all the output
you want, and "out" will contain
only the information you want.
The Popen object will then return
these values, so you can use them
as you normally would. A: As
@ceejayoz said, you can't use it
as a script because its output is

not what you want. If you want to remove all the standard output of a command, you can use the `stderr` parameter of `subprocess.Popen` and discard the `stderr` output of your command.

```
import subprocess
p = subprocess.Popen(cmd,
stdout=subprocess.PIPE,
stderr=subprocess.PIPE)
out, err = p.communicate()
if 'some error' in err:
    # some error occurred
else:
```

success A: You need to filter the output of the command. From the man pages for subprocess.call(): All communication with the child processes (including

?? ?? 4 years ago Just wanted to give you a quick heads up. The words in your post seem to be running off the screen in Ie. I'm not sure if this is a format issue
